Momtez Hlayem

2118569 – Team 08

Build role: Deployer

Week 1

What did the team publish?

In Week 1, our team started the project by identifying the problem we wanted to work on and the type of company we wanted to help. Our goal was to create a practical AI handbook for regional SMEs. The handbook should help companies understand how AI could support their work and improve their processes.

We initially considered Peeze Koffie as a potential company for the project. This gave us a starting point for discussing the needs of an SME and how our handbook could be useful in practice. We also worked on the first research proposal and the Product Requirements Document (PRD).

What did I contribute?

My main contribution in Week 1 was researching potential companies for our project. I looked into Peeze Koffie and proposed it to the team as a possible company to focus on. This helped us start discussing which company could be suitable for our research.

I also contributed ideas during our team discussions about the project direction. Through this work, I learned that choosing a company is not just about finding an interesting business. We also need to consider whether it fits the assignment and whether we can find enough relevant information to understand its needs.

What did the gates ask, and what did I change?

The feedback process encouraged us to make our research proposal and target-company choice more specific. This helped me understand the importance of checking whether a company fits the assignment and supporting our decisions with reliable information.

What did my build role produce?

I did not produce a specific output for my build role yet because the team was still defining the project and its purpose.

Week 2

What did the team publish?

In Week 2, our team worked on a handbook page about geopolitics and AI vendor models. We needed to consider not only what AI tools can do, but also who develops and operates them, where data is handled, and how much control a company has over its information.

We also had to reconsider our original target company, Peeze Koffie, after receiving feedback. The feedback raised questions about the company's ownership, possible shared resources within its wider group, the location of AI vendors, and whether our interview questions would be enough to understand the company's knowledge of AI. After researching alternatives and discussing the options, our team moved towards Giesen Roasting Solutions.

What did I contribute?

My main contribution was researching alternative companies after we received feedback about Peeze Koffie. I also participated in the discussion about choosing a new company. This helped the team reconsider its original choice and find a direction that better fitted the assignment.

This experience showed me that research is not just about collecting information to support an existing idea. It can also mean questioning an earlier decision and looking for a better option when feedback identifies problems.

What did the gates ask, and what did I change?

The feedback challenged our assumptions about the original company and highlighted gaps in our research questions, including group-level resources, AI vendor location, and the interviewee's understanding of predictive maintenance. I responded by researching alternative companies and participating in the discussion about changing our target.

What did my build role produce?

I did not contribute directly to building the agent this week, as the team was still working on the research and project direction.

Week 3

What did the team publish?

In Week 3, our team worked on a handbook page about trust and AI safety for regional manufacturing SMEs. The page explains that a company should consider three things before using AI: what data can be shared with an AI tool, what decisions AI can make, and how employees should be open about their use of AI.

The page recommends starting with a small, low-risk use case. For example, AI could warn a planner about a potentially late order, but the planner should still make the final decision. This allows a company to test AI without giving it control over important business decisions.

What did I contribute?

I helped the team check the handbook content and discuss whether the information was suitable and reliable. We needed to make sure that the page explained the risks of AI clearly and did not make claims that were not properly supported.

The feedback and gate questions made us think more carefully about the reliability of our research. For example, a source can contain a correct sentence, but the claim we build from it may still be inaccurate. We also needed to consider how privacy protections work and whether they depend on the system or on people following the rules.

What did my build role produce?

I did not produce a separate technical output this week. The development was mainly handled by Mehdi.

Week 4

What did the team publish?

Our team worked on identifying the knowledge gaps that small and medium-sized manufacturing companies face when considering AI. The aim was to understand what these companies need to know before they can use AI in a practical and responsible way.

What did I contribute?

I helped research the knowledge gaps SMEs face when adopting AI. This contributed to our understanding of the problems our handbook should address.

What did the gates ask, and what did I change?

During the mini-CBI, the lecturers asked us to demonstrate our tool, explain what makes it agentic, discuss what had not worked, and explain our interview guide and field research progress. This made me understand that we needed to show not only our research, but also how our tool worked and what still needed improvement.

What did my build role produce?

I took part in testing the agent with the rest of the team once it was ready. We tried it together and explored how it worked.

Week 5

What did the team publish?

In Week 5, our team worked on two handbook pages: one about the knowledge gaps SMEs face when using AI and another about practical AI use cases. We also created a postcard showing how AI could support a manufacturing company in the future.

What did I contribute?

I supported the team by reviewing and discussing the handbook content. I helped consider whether the information was clear and useful for SME owners and whether the examples explained AI in a practical way.

What did the gates ask, and what did I change?

The gate questions challenged us to think about how we measure the quality of our handbook. Having sources for our claims is important, but it does not automatically mean that our recommendations are correct. This made me understand that we also need to check how we interpret the evidence.

What did my build role produce?

I contributed to the group testing by trying the agent and seeing how it performed in practice. This helped me understand the difference between building an agent and checking whether it works as intended.
