Build role: Product Manager

Week 1

WHAT DID THE TEAM PUBLISH?

Our first research proposal and PRD. Our target company at that point was Koffiebranderij Peeze, a coffee roaster in Arnhem.

WHAT DID I CONTRIBUTE?

The team decided together which company to build for, and Peeze was our first choice. As product manager I focused on the PRD: what the platform must do, what it must never do, and how we would know it works. . Week 1 was mostly a brainstorming session with group members and getting to know each other.

WHAT DID THE GATES ASK, AND WHAT DID I CHANGE?

The tutor sent five questions about the PRD: what makes the platform agentic and not just a tool, which numbers show it is working and how often they are checked, what happens if the AI cannot hold long documents, who owns each open question, and whether all four steps must work from day one. They pushed us to put real targets in the PRD (at least 95% of claims with a citation, a draft ready for review in under 10 minutes, nothing published without a person approving) and to name an owner for each open question.

WHAT I DON'T UNDERSTAND YET

How we will measure those targets in practice, for example how much faster than working by hand the platform really is.

Week 2

Geopolitics & vendor models · Session Mon 14 September 2026

WHAT DID THE TEAM PUBLISH?

A page on geopolitics and vendor models, written for Giesen. It does not tell the usual "Europe has no option" story. The scheduling layer has a European option at SME prices, but the AI digital-twin layer has no commercial equivalent at this size outside a few venture-backed American platforms.

WHAT DID I CONTRIBUTE?

As product manager, I checked that the proposal still matched our PRD, so we wouldn't promise one thing and build another. We wrote the research proposal around a regional precision manufacturer like Giesen, with six themes and a quality rubric for scoring sources
I read the team's draft and gave feedback before we handed it in

WHAT DID THE GATES ASK, AND WHAT DID I CHANGE?

The tutor's letter asked four questions about our search strategy and rubric. I talked through each one with Claude before we revised the proposal. In the end we changed four things: a vendor's own document can no longer prove a cost or adoption claim on its own, because the vendor has an interest in it; we added searches for proof that a use case paid back and for what lasts after funding ends; we added Dutch

searches so we can find sources we don't already know; and "prefer primary sources" now has to happen when we search, not only when we score.

WHAT I DON'T UNDERSTAND YET

Whether the rubric really catches a biased source, or only looks as if it does.

Week 3

WHAT DID THE TEAM PUBLISH?

A page on trust and AI safety for a family-owned machine builder like Giesen. It says an owner should not try to decide whether AI is safe in general. For each use, decide three things: which data may leave the building, whether the tool may only advise or may also act, and how staff tell you they use it. It ends with an example that can be undone: a late-order warning list that advises the planner and never changes the plan. The page describes the type of firm and does not name Giesen, because we have no written consent yet.

WHAT DID I CONTRIBUTE?

I worked on the knowledge architecture and wrote the first entry in our decision log. I used Claude to help draft both and checked them against our PRD and blueprint. I also tried to find the tutor's blueprint questions, and I oversaw the interview questions.

WHAT DID THE GATES ASK, AND WHAT DID I CHANGE?

The tutor's questions on our blueprint never reached us. I could not find them in our channel, so we put the blueprint next to the PRD ourselves and found four places where they did not match: the PRD tracked five measures and the blueprint did not cover all of them; long sources had no step; the check on cost claims had no home; and no part owned the translation of Dutch sources. I changed the architecture so each of these has one owner.

WHAT DID MY ROLE PRODUCE?

The knowledge architecture (what the platform has to know, where it lives, why we compile pages ahead of time instead of searching live, and the line that keeps interview material out of the platform), the first decision-log entry, and the self-review above.

WHAT I DON'T UNDERSTAND YET

The architecture had seven parts, which turned out to be more than the team could build in the weeks we have, so it was cut down later. I want to understand better how to judge early what a team can really build.

Week 4

WHAT DID THE TEAM PUBLISH?

The page on SME knowledge gaps was still being written: what Dutch manufacturing SMEs say stops them using AI, and what a machine builder knows about its own delivery dates and planning data. The week also had the mini-CBI with the lecturers.

WHAT DID I CONTRIBUTE?

My main job this week was getting us in touch with Giesen. I tried every channel I could: LinkedIn, email, phone and Instagram, and in the end I got a call scheduled. they didn't answer, So we had no interview this week. The interview guide was ready from week 3, so we could have gone straight in.

WHAT DID THE GATES ASK, AND WHAT DID I CHANGE?

The mini-CBI asked for a demo, why our tool counts as agentic, how our research questions became interview questions, and how field research could improve the tool. Because the interview had not happened, I could not point to anything it had changed yet, and I said so. The one I had to think about longest was whether writing the interview guide improved our proposal. Our written changes came from the tutor's letter, not from the guide, and I would rather say that than invent a link.

WHAT DID MY ROLE PRODUCE?

Not an interview, but the groundwork: repeated contact attempts on four channels and one scheduled call.

WHAT I DON'T UNDERSTAND YET

How to reach a small company that doesn't answer a cold message. Next time I would ask our lecturer for an introduction earlier, instead of trying alone for so long.

Week 5

WHAT DID THE TEAM PUBLISH?

Two pages for the owner of a Dutch machine builder: one on SME knowledge gaps and one on AI use cases. Together they say that owners ask for examples, but the earlier gap is not knowing which parts of production suit AI. Most firms use AI in the office rather than the factory, and we found no measured case of AI planning at a Dutch SME machine builder. We also made our postcard from 2035 for China: a roaster builder in Wuhan whose AI proposes delivery dates while a planner decides.

WHAT DID I CONTRIBUTE?

I helped make the postcard and worked on the wiki.

WHAT DID MY ROLE PRODUCE?

The postcard and my part of the wiki.

Week 6

WHAT DID I CONTRIBUTE?

I could not contribute this week. I told the team so the others could carry the work. Next time I would say so earlier, so tasks can be redistributed sooner.

A note on how I used AI

I used Claude to help draft the knowledge architecture, the interview script and the wording of this portfolio. I checked each of them against our own documents and changed what did not match.
